Dr. P. A. Saccardo
Dear Sir

The inclosed fungus on
leaves of Amygdalus from
Southern California is
what my colleague & I
have called Cercospora
circumscissa, Sacc.

f. Amygdali, n. sp.

The conidia are not as
much attenuated above
as represented in F. Ital.
& there is a stromatic base.

Do you think this distinct
from C. circumscissa?

I have never been able to
distinguish C. circumscissa
from C. cerasella. Can you
send me good specimens of
these species?

Very Truly Yours J. B. Ellis
